

MATH 125 EXAM #4 KEY (FALL 2022)

1 $\csc \theta > 0$ and $\cot \theta < 0$ implies θ is in Quadrant II, with $r = 3$, $y = 1$, and $x = -2\sqrt{2}$. Thus $\sin \theta = \frac{1}{3}$, $\cos \theta = -\frac{2\sqrt{2}}{3}$, $\tan \theta = -\frac{1}{2\sqrt{2}}$, $\cot \theta = -2\sqrt{2}$, $\sec \theta = -\frac{3}{2\sqrt{2}}$.

2a $\frac{3\pi}{10}$ **2b** $\frac{\pi}{7}$ **2c** $\sqrt{5}$ **2d** Undefined: $\sin \frac{7\pi}{6}$ is not in domain of \sec^{-1} .

3 $f^{-1}(x) = \frac{1}{3} \cos^{-1}(-x/2)$, with $D_{f^{-1}} = R_f = [-2, 2]$ and $R_{f^{-1}} = D_f = [0, \frac{\pi}{3}]$.

4a From $(\tan \theta)(3 \tan^2 \theta - 1) = 0$ we have $\tan \theta = 0$ (so $\theta = 0, \pi$), or $\tan \theta = \frac{1}{\sqrt{3}}$ (so $\theta = \frac{\pi}{6}, \frac{7\pi}{6}$), or $\tan \theta = -\frac{1}{\sqrt{3}}$ (so $\theta = \frac{5\pi}{6}, \frac{11\pi}{6}$). Solution set is $\{0, \pi, \frac{\pi}{6}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{11\pi}{6}\}$.

4b Either $\sec \theta = -\sqrt{2}$ (so $\theta = \frac{3\pi}{4}, \frac{5\pi}{4}$) or $\sec \theta = \sqrt{2}$ (so $\theta = \frac{\pi}{4}, \frac{7\pi}{4}$). The solution set is: $\{\frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}\}$.

4c Write $4 + 4 \sin \theta = 1 - \sin^2 \theta$, so $(\sin \theta + 3)(\sin \theta + 1) = 0$. Since $\sin \theta = -3$ is impossible, we have only $\sin \theta = -1$, and thus $\theta = \frac{3\pi}{2}$.

5a Starting with the left-hand side, we have

$$\frac{\frac{1}{\sin} - \frac{\cos}{\sin}}{\frac{1}{\cos} - 1} \cdot \frac{\cos}{\cos} = \frac{(1 - \cos) \cos}{\sin(1 - \cos)} = \frac{\cos}{\sin} = \cot.$$

5b Starting with the left-hand side,

$$\frac{1}{1 - \sin} = \frac{1 + \sin}{(1 - \sin)(1 + \sin)} = \frac{1 + \sin}{1 - \sin^2} = \frac{1 + \sin}{\cos^2} = \frac{1}{\cos^2} + \frac{\sin}{\cos} \cdot \frac{1}{\cos} = \sec^2 + \tan \sec.$$

6 Let d be the distance the target is missed. Then $\tan 0.4^\circ = \frac{d}{384,000}$ implies

$$d = 384,000 \tan 0.4^\circ = 2683.7 \approx 2700 \text{ km.}$$

7 Let d be the distance between ship and lighthouse. Then

$$\tan 21^\circ = \frac{70}{d} \Rightarrow d = \frac{70}{\tan 21^\circ} = 182.4 \approx 182 \text{ m.}$$

8a $B = 110^\circ$ is immediate, and with the Law of Sines we find that $b = 3.68$ and $c = 1.34$.

8b Use the Law of Sines to get $\sin A = 2 \sin 100^\circ \approx 1.97$, which is impossible, and so no triangle results.

9 Letting d be the distance, with the Law of Sines we have

$$\frac{\sin 7^\circ}{d} = \frac{\sin 38^\circ}{600\sqrt{2}},$$

and hence $d = 168.0$ meters.
