

MATH 141 EXAM #3 KEY (SUMMER 2018)

**1a** Use L'Hôpital's rule:

$$\lim_{n \rightarrow \infty} n \tan \frac{\pi}{n} = \lim_{n \rightarrow \infty} \frac{\tan(\pi/n)}{1/n} \stackrel{\text{LR}}{=} \lim_{n \rightarrow \infty} \frac{(-\pi/n^2) \sec^2(\pi/n)}{-1/n^2} = \lim_{n \rightarrow \infty} \pi \sec^2 \frac{\pi}{n} = \pi \sec^2 0 = \pi.$$

**1b** We have

$$\begin{aligned} \lim_{n \rightarrow \infty} (\sqrt{n^4 - 2n} - n^2) &= \lim_{n \rightarrow \infty} \frac{(\sqrt{n^4 - 2n} - n^2)(\sqrt{n^4 - 2n} + n^2)}{\sqrt{n^4 - 2n} + n^2} = \lim_{n \rightarrow \infty} \frac{-2n}{\sqrt{n^4 - 2n} + n^2} \\ &= \lim_{n \rightarrow \infty} \frac{-2/n}{\sqrt{1 - 2/n^3} + 1} = \frac{0}{\sqrt{1 - 0} + 1} = 0. \end{aligned}$$

**2** Since  $-\pi/2 < \tan^{-1} n < \pi/2$  for any integer  $n$ , we have

$$-\frac{10\pi}{n^2 + 8} < \frac{20 \tan^{-1} n}{n^2 + 8} < \frac{10\pi}{n^2 + 8}$$

for all  $n$ , and since

$$\lim_{n \rightarrow \infty} \left( \pm \frac{10\pi}{n^2 + 8} \right) = 0,$$

the Squeeze Theorem implies that

$$\lim_{n \rightarrow \infty} \frac{20 \tan^{-1} n}{n^2 + 8} = 0.$$

**3** Reindex to obtain

$$\sum_{n=2}^{\infty} \frac{3}{7^n} = \sum_{n=0}^{\infty} \frac{3}{7^{n+2}} = \frac{3}{7^2} \sum_{n=0}^{\infty} \left(\frac{1}{7}\right)^n = \frac{3}{49} \cdot \frac{1}{1 - 1/7} = \frac{1}{14}.$$

**4** The  $n$ th partial sum is

$$\begin{aligned} s_n &= (\ln 2 - \ln 1) + (\ln 3 - \ln 2) + \cdots + [\ln n - \ln(n-1)] + [\ln(n+1) - \ln n] \\ &= -\ln 1 + \ln(n+1) = \ln(n+1), \end{aligned}$$

and so

$$\sum_{n=1}^{\infty} \ln\left(\frac{n+1}{n}\right) = \lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \ln(n+1) = \infty.$$

That is, the series diverges.

**5** Find the smallest integer value of  $n$  for which  $\frac{1}{2n^4} < \frac{1}{10,000}$ . Since

$$\frac{1}{2n^4} < \frac{1}{10,000} \Rightarrow n^4 > 5000,$$

and 9 is the first integer for which  $9^4 > 5000$ , estimation with the first eight terms will suffice:

$$\sum_{n=1}^{\infty} \frac{(-1)^n}{2n^4} \approx \sum_{n=1}^8 \frac{(-1)^n}{2n^4}$$

has absolute error less than  $10^{-4}$ .

**6a** For all  $n \geq 1$  we have

$$0 < \frac{4}{2 + 3^n} \leq \frac{4}{3^n} \leq \frac{4}{3^n},$$

and since  $\sum 4/3^n$  is a convergent geometric series, we conclude by the Direct Comparison Test that the given series converges.

**6b** Since

$$\lim_{n \rightarrow \infty} \frac{4^n}{n^2} = +\infty,$$

the series diverges by the Divergence Test.

**6c** For all  $n \geq 1$  we have

$$0 \leq \frac{\tan^{-1} n}{n^2} \leq \frac{\pi}{2n^2},$$

and since  $\sum 1/n^2$  is a convergent  $p$ -series, it follows that  $\sum \pi/2n^2$  is likewise convergent, and therefore the given series converges by the Direct Comparison Test.

**6d** Since

$$\begin{aligned} \rho &= \lim_{n \rightarrow \infty} \left| \frac{2^{n+1}(n+1)!}{(n+1)^{n+1}} \cdot \frac{n^n}{2^n n!} \right| = 2 \lim_{n \rightarrow \infty} \frac{n^n}{(n+1)^n} = 2 \lim_{n \rightarrow \infty} \exp\left(n \cdot \ln \frac{n}{n+1}\right) \\ &= 2 \exp\left(\lim_{n \rightarrow \infty} \frac{\ln n - \ln(n+1)}{1/n}\right) \stackrel{\text{LR}}{=} 2 \exp\left(\frac{1/n - 1/(n+1)}{-1/n^2}\right) \\ &= 2 \exp\left(-\lim_{n \rightarrow \infty} \frac{n}{n+1}\right) = 2 \exp(-1) = \frac{2}{e} < 1, \end{aligned}$$

the series converges by the Ratio Test.

**6e** Since

$$\lim_{n \rightarrow \infty} n^{-1/n} = \lim_{n \rightarrow \infty} \exp\left(-\frac{\ln n}{n}\right) = \exp(0) = 1 \neq 0,$$

the series diverges by the Divergence Test.

**6f** Since

$$\begin{aligned}\rho &= \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left( \frac{1 \cdot 3 \cdot 5 \cdots [2(n+1) - 1]}{[2(n+1) - 1]!} \cdot \frac{(2n-1)!}{1 \cdot 3 \cdot 5 \cdots (2n-1)} \right) \\ &= \lim_{n \rightarrow \infty} \frac{2(n+1) - 1}{2n(2n+1)} = \lim_{n \rightarrow \infty} \frac{2n+1}{4n^2+2n} = 0,\end{aligned}$$

the series converges by the Ratio Test.

**7a** Since  $(1/n^{5/4})$  is a decreasing sequence of nonnegative values such that  $1/n^{5/4} \rightarrow 0$  as  $n \rightarrow \infty$ , the series converges by the Alternating Series Test. Since  $\sum 1/n^{5/4}$  is a convergent  $p$ -series, the given series is also absolutely convergent.

**7b** Since

$$\lim_{n \rightarrow \infty} \frac{n}{\ln n} = +\infty$$

the series diverges by the Divergence Test.
